Q3 Report

Published On 12 October 2026

Disclaimer

This document (“Report”) has been prepared by Fluid for general informational purposes. It is intended to provide insight into the protocol’s performance, initiatives, and outlook, but does not constitute financial, investment, legal, or tax advice.

All information, figures, and statements presented in this Report are based on data believed to be accurate at the time of publication, derived from internal systems and public blockchain sources. Metrics and projections are subject to change, and past performance is not indicative of future results.

This Report may include forward-looking statements regarding future plans, product development, ecosystem growth, or other anticipated outcomes. These statements are inherently uncertain and involve risks beyond Fluid’s control. Actual results may differ materially from those expressed or implied.

Fluid makes no guarantees or representations as to the accuracy, completeness, or reliability of the information herein, and assumes no obligation to update or revise this document in light of new data or future events.

References to other projects, protocols, or third-party entities are provided for context only and do not imply endorsement, or recommendation.

A note from the team...

Q3 was the quarter Fluid's liquidity layer started working for asset issuers and institutions, not only DeFi users.

In July we launched Liquidity as a Service (LaaS). Stablecoin and RWA issuers now get deep, managed DEX liquidity from Fluid with no inventory, no position management and no impermanent loss. Within weeks, Fluid became the main venue for its first partners: over 90% of DEX volume in Huma's PST and USD.AI's sUSDai now trades on Fluid.

In August, Jupiter Lend v2 brought Smart Collateral and Smart Debt to Solana, so the same dollar can earn lending yield and trading fees on both of the largest L1s. We also completed a full rebrand.

The numbers followed. Total market size grew 22% to $4.12B, active loans grew 11% to $1.69B and revenue grew 19% to $2.02M, rising every month of the quarter.

Q4 has started with Fluid powering Bitcoin-backed lending on Sui through Hashi, with Anchorage Digital as a launch partner. DEX v2 development is complete. The goal hasn't changed: one liquidity layer that powers lending, trading and liquidity for every asset that comes onchain.

We're grateful to have you with us on this journey.

- The Fluid Team

Executive Summary

Total Market Size

$4.12B

↗ 22% QoQ

Active Loans

$1.69B

↗ 11% QoQ

Trading Volume

$10.4B

Revenue

$2.02M

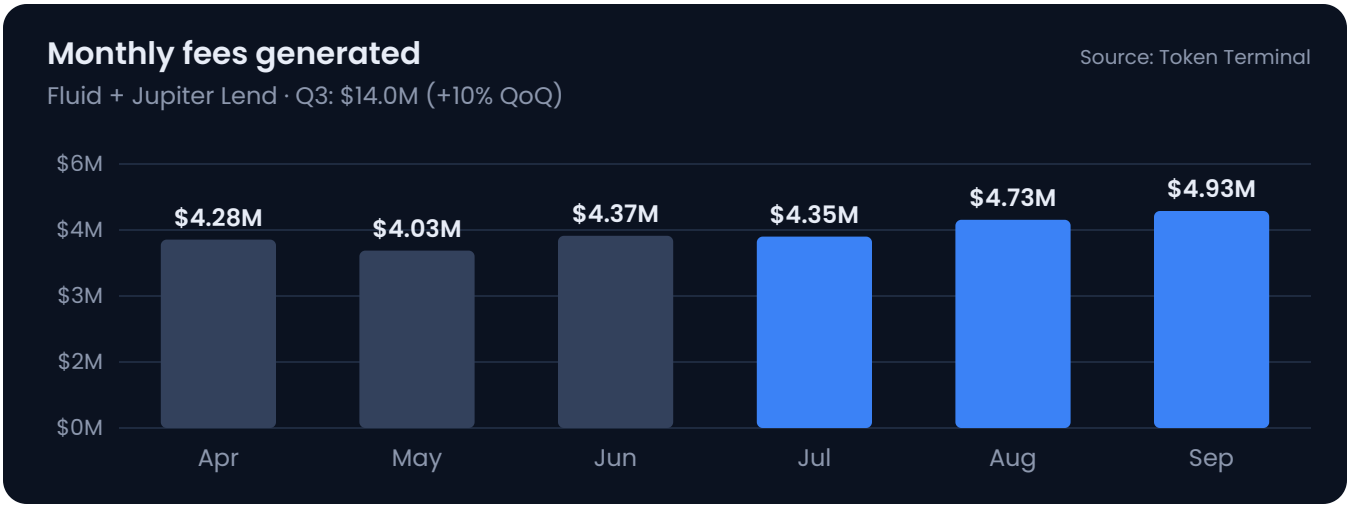

↗ 19% QoQ

Fluid grew across its lending metrics in Q3. Total market size rose 22% QoQ to $4.12B and active loans rose 11% to $1.69B. Solana, through Jupiter Lend, is now Fluid's largest deployment at $2.33B, followed by Ethereum at $1.34B (+31% QoQ) and Arbitrum at $286M (+41% QoQ).

Trading volume fell to $10.4B from $17.9B as activity in stable and correlated pairs compressed across Ethereum (Curve's volume fell 37% over the same period). Fluid still finished Q3 as the #2 DEX on Ethereum and remains the most capital-efficient DEX at scale: $362 of volume for every $1 of liquidity over the past 12 months, against $107 for Uniswap and $43 for Curve.

Revenue grew 19% QoQ to $2.02M, including $0.28M from Lite USD, and rose every month of the quarter. Fees generated across Fluid and Jupiter Lend rose 10% to $14.0M and increased every month of the quarter.

In Q4, growth will come from Hashi on Sui, new LaaS facilities, DEX v2, and custodied collateral with Anchorage Digital.

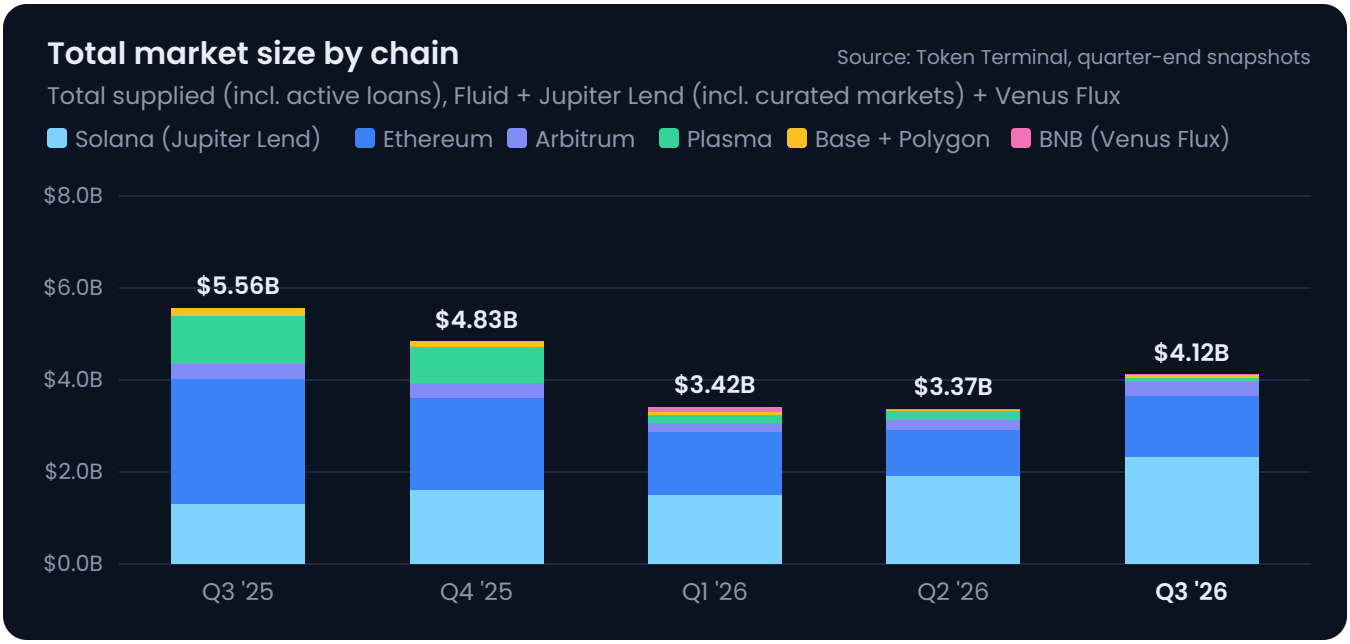

fluid

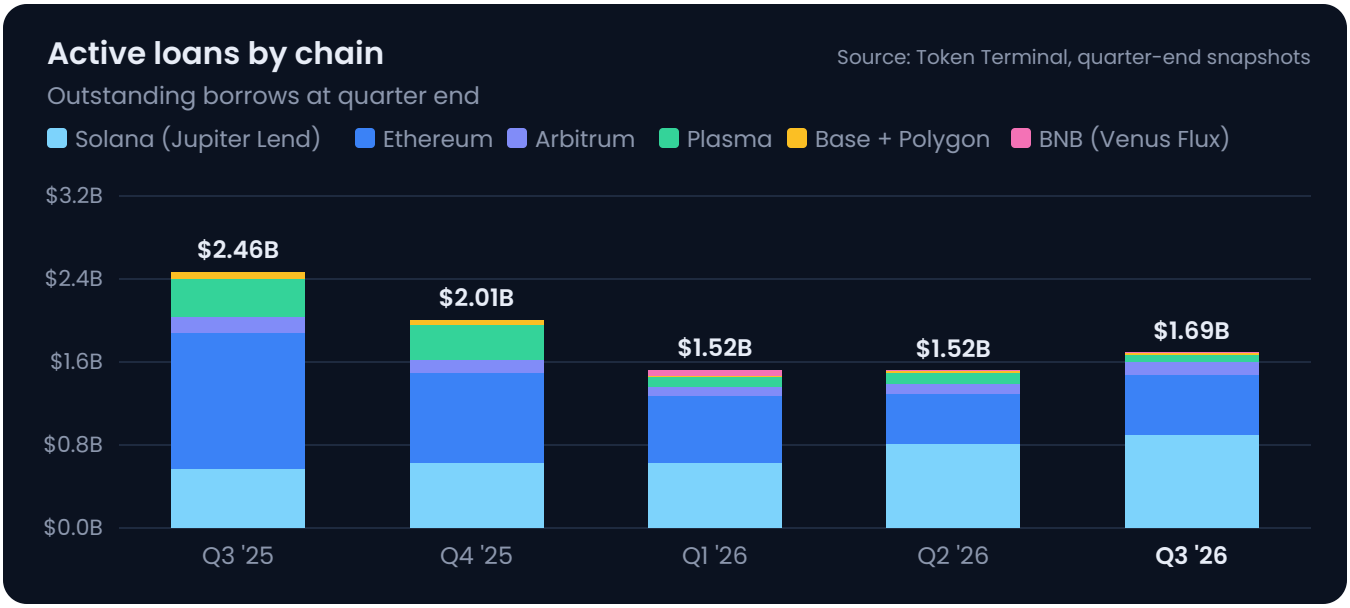

Product Summary

Fluid Lending

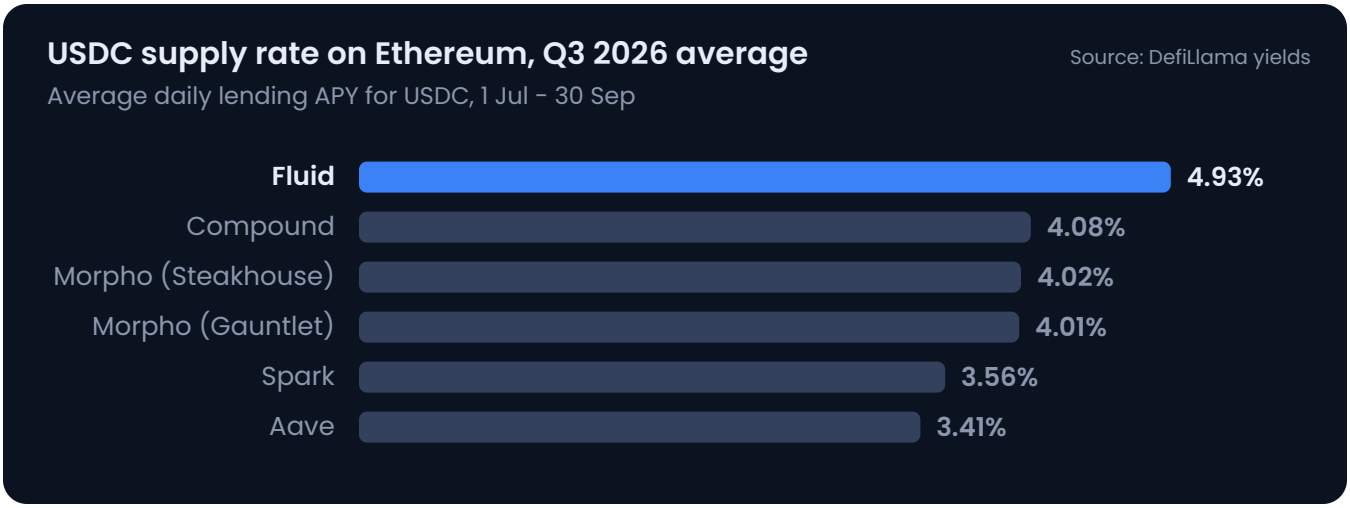

Total Market Size	Active Loans
$4.12B	$1.69B

Total market size grew 22.2% QoQ to $4.12B and active loans grew 11.4% to $1.69B. Growth came from Fluid's two largest deployments: Solana via Jupiter Lend (+22% to $2.33B) and Ethereum (+31% to $1.34B). Arbitrum (+41%) and Base (+69%) also grew, while Plasma declined to $108M.

Fluid paid USDC lenders on Ethereum more than any other major money market in Q3: 4.93% on average, against 4.08% on Compound, about 4.0% on Morpho's largest USDC vaults, 3.56% on Spark and 3.41% on Aave.

Tokenized credit is now one of Fluid's largest collateral types. Across Fluid and Jupiter Lend, about $266M of USD.AI's sUSDai is deposited, and Huma Finance's PST has grown to about $121M on Fluid.

Fluid DEX

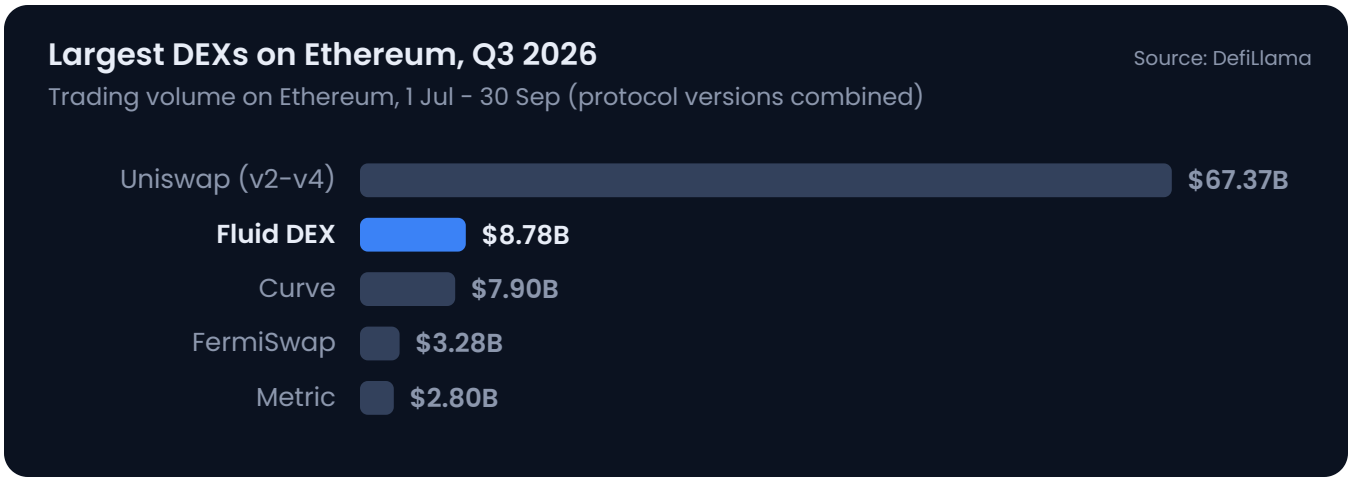

On Ethereum

#2 DEX

Trading Volume

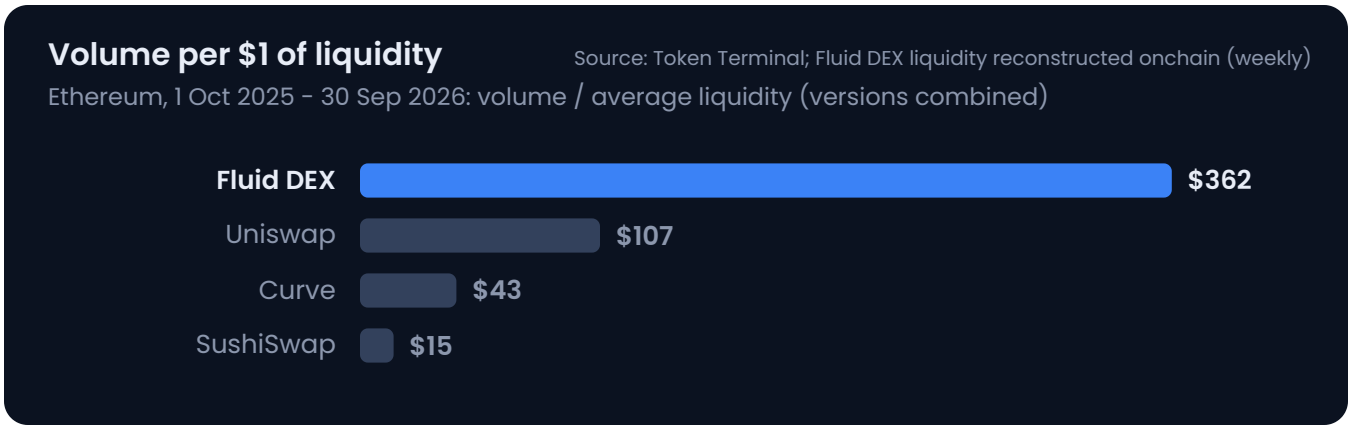

$10.4B

Fluid finished Q3 as the second largest DEX on Ethereum by volume ($8.8B), while only listing stable and correlated pairs. Total volume across Fluid DEX and the new Jupiter Lend DEX was $10.4B, down from $17.9B in Q2, as volatility and volume in these pairs fell across the market. Fluid DEX liquidity on Ethereum grew 80% over the quarter, from $122M to $219M.

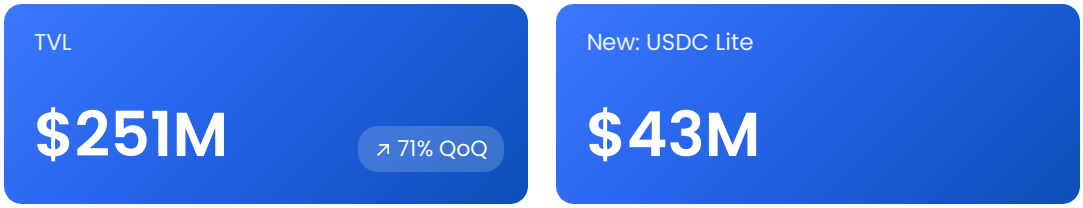

Smart Collateral and Smart Debt let the same capital back loans and provide DEX liquidity at once. That is why Fluid turns over its liquidity faster than any other large DEX on Ethereum: $362 of volume per $1 of liquidity over the last 12 months, 3.4x Uniswap and 8.4x Curve. For asset issuers, it means deeper and tighter markets for a fraction of the capital.

DEX v2 development is complete. It brings the same capital efficiency to volatile pairs such as ETH/USDC, a market Fluid DEX does not serve today and one that generates far more fees than correlated pairs.

Fluid Lite

Fluid Lite's TVL grew 71% in Q3, from $147M to $251M. The ETH Lite vault grew 9% in ETH terms to 77.5K stETH. The new USDC Lite vault reached $43M by quarter end and is also the capital source for Liquidity as a Service. Lite USD earned $0.28M in revenue in Q3.

Liquidity as a Service

Commitments Closed

$100M+

Max Per Facility

$500M

Launched on 22 July, LaaS lets stablecoin, yield-bearing stablecoin and RWA issuers buy DEX liquidity as a service. Fluid deploys and manages the liquidity with its own capital from the USDC Lite vault, and the issuer pays a flat fee. Issuers need no inventory, manage no positions and take no impermanent loss. Terms are set in signed legal contracts, and each facility can provide up to $500M of liquidity across EVM chains and Solana.

The first results show what deep, managed liquidity does for a new asset:

Asset	Peg / spread	Share of DEX volume on Fluid
PST Huma Finance	Typical daily range tightened 7x, from 59 bps before Fluid to 8.4 bps	**97.5%**
sUSDai USD.AI	Average close 1.9 bps from midpoint; every day traded inside a ±15 bps band	**94%**

Share of DEX volume over the 30 days to 9 October 2026. Ranges based on daily trading data before and after liquidity moved to Fluid.

LaaS also changes Fluid's revenue mix. Fees are contracted and paid regardless of market conditions, so they add a stable revenue line on top of lending and trading fees. LaaS fees accrued $230K in Q3 and rose every month, from $63K in July to $95K in September.

fluid

Strategic Partnerships

Jupiter Lend

Total Market Size

$2.33B ↗ 22% QoQ

Active Loans

$894M ↗ 10% QoQ

Jupiter Lend, powered by Fluid, is now Fluid's largest deployment. Its market size grew 22% QoQ to $2.33B and active loans grew 10% to $894M, both including its curated markets. Deposits reached a new all-time high of $2.40B on 28 September. Fluid and Jupiter share revenue 50/50: Fluid provides the infrastructure and Jupiter provides distribution.

On 10 August, Jupiter Lend v2 brought Smart Collateral and Smart Debt to Solana, so USDC, USDT, SOL and SOL LST deposits and debt can provide DEX liquidity and earn trading fees on top of lending yield. The Jupiter Lend DEX processed $0.80B in Q3. September volume ($0.59B) was 2.8x August's, and all-time volume passed $1B in October.

Curated Markets on Jupiter Lend

Curated markets let professional risk curators run isolated markets with their own assets, risk parameters, oracles and admin controls, while Fluid provides the engine and liquidity. Curators set the risk framework but never custody user funds.

Bitwise × Ethena · 30 Sep

$395M

Sentora · 30 Sep

$68M

Bitwise × Ethena

Bitwise became the first third-party risk curator on Fluid's infrastructure, co-curating an Ethena market on Jupiter Lend with USDe, USDG and SOL. The market closed Q3 at $395M in total supplied, with $173M borrowed. As of 11 October it stands at $119M, with $55M borrowed.

Sentora

Sentora launched a curated PYUSD market on Jupiter Lend at the end of September, with PYUSD Earn and USDe/PYUSD borrowing. It closed Q3, its first days live, at $68M in total supplied with $17M borrowed.

Asset Issuers: Huma, USD.AI, Re, Aave (GHO)

Asset issuers keep choosing Fluid as their main liquidity venue because Smart Collateral and Smart Debt give them deep DEX liquidity at a fraction of the cost. PST and sUSDai (LaaS partners) trade almost entirely on Fluid. Re's reUSD also moved its main market to Fluid: 79% of reUSD DEX volume now trades on Fluid and its typical daily range is 2.8x tighter (19 bps before, 7.0 bps on Fluid), and Fluid's share of GHO DEX volume rose from 34% in July to 63% over the last 30 days.

fluid

Looking Forward

Q4 has already started with several launches. These are the priorities for the rest of the year.

Hashi: Bitcoin lending on Sui

Hashi's mainnet rolls out on Sui in October with more than $500M in capital commitments from its launch coalition. Fluid powers Hashi's entire money market, and with Anchorage Digital as a launch partner Fluid will bring Bitcoin-backed loans to Anchorage users through both tri-party custody and direct self-custody. After Solana, Sui is Fluid's second non-EVM ecosystem.

DEX v2

DEX v2 development is complete. It extends Smart Collateral and Smart Debt to volatile pairs and adds collateral and debt range orders, cross-margin between lending and DEX, hooks, flash accounting and permissionless market creation. Volatile pairs generate far more fees than the correlated pairs Fluid serves today, making DEX v2 Fluid's largest revenue opportunity.

Custodied Collateral

Institutions and funds often hold assets with trusted custodians rather than in onchain wallets. Custodied collateral lets them borrow against those assets with Fluid's liquidity.

More LaaS Facilities

New LaaS partners are onboarding across EVM chains and Solana, starting with OSL's USDGO stablecoin on Jupiter Lend.

Institutional Deployments

Following Bitwise × Ethena and Sentora, more professional asset managers and curators can run their own markets on Fluid, with their own risk parameters and access rules.

fluid

$FLUID

$FLUID

$FLUID rose 78% in Q3, from $0.82 to $1.47.

Value Accrual

All current and future value accrues to the DAO, and thus to token holders. Buybacks have bought back about 1.3% of supply to date. New revenue lines, including LaaS fees and Jupiter Lend DEX fees, also accrue to the DAO.

Transparency

The $FLUID transparency page remains the single source for tokenholder data, including revenue, DAO treasury and buyback status. Fluid also keeps its Blockworks Token Transparency filing up to date (latest filed 18 June 2026). Fluid also published its H1 2026 recap, covering an expanded asset listing framework, granular limits and Oracle v2.

The team's focus is unchanged: grow every top-line metric and revenue, and return maximum value to token holders.

Methodology

Quarters are calendar quarters; Q3 2026 is 1 July to 30 September. Total market size, active loans and all chain and product breakdowns are Token Terminal figures at quarter end (23:59 UTC). Total market size is Token Terminal's TVL for Fluid, which counts total supplied (including the portion lent out) across Fluid on Ethereum, Arbitrum, Base, Plasma and Polygon (including Fluid Lite), Jupiter Lend and Venus Flux. Jupiter Lend figures include its curated markets (Bitwise × Ethena, Sentora). Curated market sizes on the Curated Markets page are total supplied, reconstructed onchain from the markets' liquidity accounts at 23:59 UTC on each date. Prior quarters use the same Token Terminal method and may differ from earlier reports.

Revenue is from the $FLUID page (fluid.io/fluid), including Fluid's share of Jupiter Lend revenue, and Lite USD net margin from Q3 onwards. Fees are Token Terminal fees for Fluid (Fluid Vault, Fluid DEX, Fluid Lite, Venus Flux) plus Jupiter Lend's borrower fees. Trading volume is DefiLlama volume for Fluid DEX and Fluid DEX Lite (all EVM chains) plus Jupiter Lend DEX. Ethereum DEX rankings use DefiLlama volume and combine protocol versions (e.g. Uniswap v2, v3 and v4). Volume per $1 of liquidity divides Ethereum volume from 1 October 2025 to 30 September 2026 by average liquidity over the same period; peers use Token Terminal DEX volume and TVL, and Fluid DEX liquidity is reconstructed onchain from weekly snapshots. USDC rates are DefiLlama daily supply APYs for each protocol's main Ethereum USDC market, averaged over Q3. $FLUID prices are daily closes.
